

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**LISTING OF CLAIMS:**

1. (Original) A spherical composite composition which is made by adding (B) 5 to 1,000 parts by weight of a magnetic material having the longest length in two-dimensional projection of 0.01 to 50  $\mu\text{m}$ , relative to 100 parts by weight of a resin comprising unsaturated vinyl units having (A-1) a glass transition temperature of 50 to 150°C and (A-2) a weight average molecular weight of 10,000 to 1,000,000, wherein the average particle diameter is 1 to 100  $\mu\text{m}$ , and the sphericity is 0.7 to 1.

2. (Original) The spherical composite composition according to claim 1, wherein the resin comprising unsaturated vinyl units contains 30 to 100 % by weight of at least one kind of a monomer unit selected from acrylonitrile unit and methacrylonitrile unit.

3. (Original) The spherical composite composition according to claim 1, wherein the resin comprising unsaturated vinyl units contains 30 to 100 % by weight of at least one kind of a monomer unit selected from a methyl (meth)acrylate unit, an ethyl (meth)acrylate unit, a butyl (meth)acrylate unit, a styrene unit, an  $\alpha$ -methylstyrene unit and a vinyl toluene unit.

4. (Original) A process of producing a spherical composite composition which is the obtained by adding (B) 5 to 1,000 parts by weight of a magnetic material having the longest length in two-dimensional projection of 0.01 to 50  $\mu\text{m}$ , relative to 100 parts by weight of a resin dispersed in an aqueous medium comprising unsaturated vinyl units having (A-1) an average particle diameter of 0.01 to 1  $\mu\text{m}$ , (A-2) a glass transition temperature of 50 to 150°C, and (A-3) a weight average molecular weight of 10,000 to 1,000,000, dispersing the material in the medium, and then forming the dispersion into particles by spray drying, wherein the average particle diameter is 1 to 100  $\mu\text{m}$ , and the sphericity is 0.7 to 1.

5. (Original) The process of producing a spherical composite composition according to claim 4, wherein the resin comprising unsaturated vinyl units contains 30 to 100 % by weight of at least one kind of a monomer unit selected from an acrylonitrile unit and a methacrylonitrile unit.

6. (Original) The process of producing a spherical composite composition according to claim 4, wherein the resin comprising unsaturated vinyl units contains 30 to 100 % by weight of at least one kind of a monomer unit selected from a methyl (meth)acrylate unit, an ethyl (meth)acrylate unit, a butyl (meth)acrylate unit, a styrene unit, an  $\alpha$ -methylstyrene unit and a vinyl toluene unit.

7. (Original) The process of producing a spherical composite composition according to claim 4, wherein the inlet temperature of hot air in the spray drying device in spray drying is from 100°C to the temperature which is the glass transition

temperature of the resin plus 150°C, and the outlet temperature of hot air in the spray drying device is from 40°C to the temperature which is the glass transition temperature of the resin plus 50°C.

8. (Currently Amended) A resin magnet which comprises the spherical composite composition according to ~~any one of claims 1 to~~ claim 3.

9. (Currently Amended) An electric wave absorption material which comprises the spherical composite composition according to ~~any one of claims 1 to~~ claim 3.

10. (Currently Amended) A magnetic shield material which comprises the spherical composite composition according to ~~any one of claims 1 to~~ claim 3.

11. (Currently Amended) A magnetic toner material used in a developer which comprises the spherical composite composition according to ~~any one of claims 4 to~~ claim 3.

12. (Currently Amended) A toner carrier material used in a developer of electric photograph process which comprises the spherical composite composition according to ~~any one of claims 1 to~~ claim 3.

13. (New) A resin magnet which comprises the spherical composite composition according to claim 2.

14. (New) An electric wave absorption material which comprises the spherical composite composition according to claim 2.

15. (New) A magnetic shield material which comprises the spherical composite composition according to claim 2.

16. (New) A magnetic toner material used in a developer which comprises the spherical composite composition according to claim 2.

17. (New) A toner carrier material used in a developer of electric photograph process which comprises the spherical composite composition according to claim 2.

18. (New) A resin magnet which comprises the spherical composite composition according to claim 1.

19. (New) An electric wave absorption material which comprises the spherical composite composition according to claim 1.

20. (New) A magnetic shield material which comprises the spherical composite composition according to claim 1.

21. (New) A magnetic toner material used in a developer which comprises the spherical composite composition according to claim 1.

22. (New) A toner carrier material used in a developer of electric photograph process which comprises the spherical composite composition according to claim 1.
